Background
In Sub-Saharan Africa, adolescents are faced with numerous health challenges which affect their productive contribution to development. In 2009, about 12% of girls aged 15-19 years in Ghana were pregnant or already mothers.

Using the Multi-Layered Resilience Framework (Obrist et al., 2010) this study aims at analyzing factors that can build adolescents’ resilience against teenage pregnancy and enable already pregnant girls to cope well with teenage pregnancy and early motherhood.

Research Objectives
1. To investigate how adolescents in Begoro interpret their sexuality and teenage pregnancy
2. To Identify female adolescents’ capacities, social connections and involvement in institutions and organizations that might contribute to building resilience against teenage pregnancy
3. To analyze how social actors, institutions and organizations can build resilience of adolescents against teenage pregnancy in the district.

Approach
A mixed method approach is being used for data collection:

• For the quantitative data (cross-sectional survey) 500 adolescent girls, aged 15-19, were sampled from Begoro a peri-urban community using multistage cluster sampling.

• Purposive sampling was used to select 20 (10 high and 10 low resilient) girls for follow up over the course of four months for qualitative data collection using in-depth interviews and observation to identify resilient pathways.

Preliminary findings
• 500 adolescent girls were interviewed
• 81 (16%) have ever been pregnant or were pregnant, indicating that pregnancy rates did not decrease in the past years. In 2008, 16% of adolescent girls in rural areas began child bearing between the ages of 15-19 years (Ghana Demographic Health Survey, 2008).
• 65% of the never pregnant girls had someone they could turn to in case they had questions or needed support related to how to protect themselves against teenage pregnancy.

• 69% of the ever pregnant girls had someone they could turn to when they need support related to pregnancy and neonatal care.
• 80% of the ever pregnant girls and 90% of the never pregnant girls had access to other sources of information
